Sample Multiple Choice Questions and Answers from the 2012 Biology Exam

Below, we analyze some typical MCQs from the 2012 exam, providing correct answers and detailed explanations.

Question 1: Cell Structure

Which organelle is responsible for energy production in eukaryotic cells?

- A) Nucleus
- B) Ribosome
- C) Mitochondrion
- D) Chloroplast

Answer: C) Mitochondrion

Explanation:

The mitochondrion is known as the "powerhouse" of the cell because it produces ATP through cellular respiration, providing energy necessary for various cellular activities. The nucleus contains genetic material, ribosomes synthesize proteins, and chloroplasts (in plant cells) are involved in photosynthesis, not energy production in animals.

Question 2: Genetics

In pea plants, the allele for tall stems (T) is dominant over the allele for short stems (t). What is the genotype of a heterozygous tall plant?

- A) TT
- B) Tt
- C) tt
- D) tt or Tt

Answer: B) Tt

Explanation:

A heterozygous organism has two different alleles. For a tall plant with one dominant and one recessive allele, the genotype is Tt. TT would be homozygous dominant, and tt would be homozygous recessive.

Question 3: Ecology

Which of the following best describes a keystone species?

- A) A species that is most abundant in an ecosystem
- B) A species that has a disproportionate effect on its environment relative to its abundance
- C) A species that is at the top of the food chain
- D) A species that migrates seasonally

Answer: B) A species that has a disproportionate effect on its environment relative to its abundance

Explanation:

Keystone species play a critical role in maintaining the structure of an ecosystem. Their presence or absence significantly impacts other species and the overall health of the ecosystem, regardless of their population size.

Question 4: Physiology

Which human organ system is primarily responsible for regulating body temperature?

- A) Nervous system
- B) Endocrine system
- C) Integumentary system
- D) Muscular system

Answer: C) Integumentary system

Explanation:

The integumentary system, comprising the skin, hair, and nails, helps regulate body temperature through processes like sweating and blood vessel dilation/constriction. While the nervous system detects temperature changes, the integumentary system executes the response.

Question 5: Biochemistry

Enzymes are biological catalysts that speed up reactions by lowering the activation energy. Which of the following factors can affect enzyme activity?

- A) Temperature
- B) pH levels
- C) Substrate concentration
- D) All of the above

Answer: D) All of the above

Explanation:

Enzyme activity is influenced by temperature (optimal range), pH (enzyme's pH stability), and substrate concentration (more substrate can increase activity up to a point). Deviations from optimal conditions can denature enzymes or reduce their efficiency.
